## More Outputs for Camera Accessories

PAG has introduced a new device for powering camera accessories from its PAGlink system of intelligent, high-power, linking batteries.

The PAGlink battery system is designed for high load camera set-ups; the linked batteries provide up to 12A, enabling you to power simultaneously the camera and multiple 12V accessories, such as a camera light, a monitor, and audio or transmission devices. The PowerHub provides the multiple outputs that are required to do this.

PowerHub incorporates four D-Tap output connector units, which have been designed to be interchangeable with other connectors of your choice, such as PP90 or Hirose (available separately, in due course).

The PowerHub draws power from contacts on the face of the PAGlink battery. PAGlink is the only battery system that provides power for accessories from its linking contacts. The PowerHub can be used sandwiched between two batteries or connected to the rear battery, where an accessory bracket can be mounted to the unit's face.

The outputs can be positioned to the left or right side of the camera allowing you to configure the PowerHub to your individual requirement.

A USB module (1 amp) has also been incorporated allowing you to charge your smartphone, or power other accessories.

The ultra-compact and lightweight PowerHub measures just 12mm in depth when between batteries.

PAG is one of the broadcast industry's longest established providers of innovative and high quality camera power and lighting systems.
